- Various aftercare guides from reputable **tattoo artists**

CONFIGURATIONS

System prompt Summary:

- **Role:** Expert Tattoo Aftercare Consultant (reassuring, no-nonsense persona).
- **Data Source Limit:** Must *strictly* use only provided data (Grounded Response).
- **Handle Unknowns:** Politely state inability to answer questions outside the knowledge base.
- **Handle Contradictions:** Present *all* conflicting data points/options from the sources.
- **Language:** Must use "regular person talk," avoiding complex medical jargon.
- **Structure:** Start with a 1-sentence summary, then detail the explanation.
- **Citation:** Always cite the source document used at the end of the response.
- **Safety:** Must include a medical/professional advice disclaimer.

- LLM: gemini-2.5-flash
- Embedding-model__and__Splitting-model: `"sentence-transformers/all-MiniLM-L6-v2"`
    - Buffer size: 3
    - Breakpoint % threshold: 65
- Vector configurations
    - Top k: 6
    - Chunk size: 800
    - Chunk overlap: 50
- Chat Memory Configurations:
    - Token Limit: 3900
    - Reranker top n: 2
- Reranker-model: `"cross-encoder/ms-marco-MiniLM-L-6-v2"`

Model evaluation

A highly effective system. Responses are grounded in the source material while simultaneously providing focused and comprehensive answers.

Faithfulness = 1.0

Precision ≈ 0.92

Recall ≈ 0.96

TAT CHAT

EXPERT CHATBOT FOR TATTOO HEALING AND INFECTION RISKS

Hi there! I'm an AI chatbot here to help you with information about tattoo aftercare and infection risks. Just a friendly reminder that I can't replace advice from a medical professional or your own tattoo artist, but I'll do my best to give you helpful tips based on the information I have. How can I assist you today?

i got a tattoo! can i go swimming?

Congratulations on your new tattoo! You should definitely avoid swimming until your tattoo has completely healed.

It's really important not to soak your new tattoo or go swimming until it's fully healed. This also includes activities like bathing and using a sauna during the healing period.

This information comes from my sources at the Public Health Department of the Government of South Australia and the tattoo aftercare guide from the European Academy of Dermatology & Venereology.

how long does that take?

Generally, you should allow up to two weeks for your new tattoo to heal before you can go swimming or soak it.

During this healing period, which can take up to two weeks, you might notice some normal signs of healing. For example, the superficial layers of the tattooed skin will peel away during the first weeks. After a few days, you might also notice some peeling and possibly a little scabbing, which is completely normal and no cause for concern. It's crucial to avoid soaking your tattoo or swimming until it is completely healed.

This information comes from my sources at the Public Health Department of the Government of South Australia and the tattoo aftercare guide from the European Academy of Dermatology & Venereology.

my friend has a tattoo that he got last week, its peeling. is that ok?

Yes, it's completely normal for a tattoo to be peeling after about a week!

The superficial layers of the tattooed skin will naturally peel away during the first few weeks of healing. You might notice some peeling and possibly a little scabbing after a few days, and this is a normal part of the process, so there's no need to worry.

This information comes from my sources at the Public Health Department of the Government of South Australia and the tattoo aftercare guide from the European Academy of Dermatology & Venereology.

my other friend has a tattoo that is three weeks old, and his whole arm is red and swollen

It sounds like your friend's situation with widespread redness and swelling three weeks after getting a tattoo isn't typical for normal healing and could be a sign of a problem.

Here's why:

- **Normal Healing:** Mild redness and swelling are normal in the first few hours or days after getting a tattoo, but they should decrease rapidly and get better every day.
- **Alarm Signs:** If redness is increasing and spreading around the tattooed area, or if there's increasing pain, throbbing, and burning, these are considered alarm signs. The presence of "lots of redness" or "inflammation" (which is what swelling often indicates) is also a reason to seek advice.

Given that your friend's tattoo is three weeks old and the whole arm is red and swollen, it's really important for them to notify their tattoo artist and seek medical advice right away. This kind of persistent or worsening inflammation isn't a normal part of the healing process at this stage.

This information comes from my sources at the Public Health Department of the Government of South Australia and the tattoo aftercare guide from the European Academy of Dermatology & Venereology.

my momma says im gonna get hepc from mt new tatoo

It's understandable why your mom might be concerned, as Hepatitis C is a serious topic! Here's the scoop on tattoos and Hepatitis C, based on the information I have:

While Hepatitis C is a virus that *can* be transmitted through tattooing because it's a blood-borne pathogen, the risk really depends on where and how you got your tattoo.

Here are the details:

- **Professional Tattoo Parlors:** If you received your tattoo at a professional tattoo parlor, definitive evidence of an increased risk of Hepatitis C infection was **not** observed. This is likely because health care interventions have been adopted to try and prevent the transmission of viral agents during tattoo acquisition.
- **Higher Risk Situations:** The risk of Hepatitis C transmission from tattoos is more prevalent in certain situations. For example, there's an increased risk if a tattoo is applied by friends, acquired in prison using non-sterile equipment, or if the recipient belongs to a high-risk group such as persons who use intravenous drugs, prisoners, and veterans.

  So, while the potential to acquire blood-borne viral pathogens like Hepatitis C during tattooing still exists, getting your tattoo from a professional parlor significantly reduces that risk due to the infection control guidelines they maintain.

  This information comes from my sources at the Department of Dermatology, UC Davis Medical Center.
